                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17, Application US/07946421
Patent No. 5558864
GENERAL INFORMATION
APPLICANT: Bendig, Mary M.
APPLICANT: Retileborough, Catherine A.
APPLICANT: Saldanha, Jose
TITLE OF INVENTION: Humanized and Chimeric Monoclonal
TITLE OF INVENTION: Antibodies
NUMBER OF SEQUENCES: 42
CORRESPONDENCE ADDRESS:
ADDRESSEE: Millen, White, Zelano & Branigan, P.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DB 4; L6

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1.1 Application US/09205231

Patent No. 6121423

GENERAL INFORMATION:

APPLICANT: TSUCHIYA, Masayuki

APPLICANT: HIRATA, Yuichi

TITLE OF INVENTION: RESHAPED HUMAN ANTIBODY TO HUMAN

TITLE OF INVENTION: INTERLEUKIN-6

NUMBER OF SEQUENCES: 91

CORRESPONDENCE ADDRESS:

ADDRESSE: Folley & Lardner

STAFET: 3000 K Street, N.W., Suite 500

CITY: Washington

STAFE: D.C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 32;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           COUNTRY: USA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
rheumatoid arthritis, and ocular disorders comprises a kininogen domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis C virus; HCV; epitope; vaccine; immunogen; HLA-binding motif;
                                                                   anti-angiogenic D3 peptide (see AAY95408) derived from human high mol.wt. kininogen (HK) domain 3 (see AAY95406). The full-length D3 peptide inhibits endothelial cell proliferation and thus possesses anti-angiogenic activity. It is an example of peptides of the invention (see AAY95405-26) that are analogues of certain sites in the HK domain 3. The peptides inhibit endothelial cell proliferation and may also induce endothelial cell apoptosis. Compositions including the peptides are used in claimed methods for inhibiting angiogenesis. Inhibiting endothelial cell proliferation, and inducing endothelial cell apoptosis. Cancer, rhemmatoid arthritis, and ocular disorders characterized by undesired vascularization of
                                                                                                                                                                                                                                                                                       Gaps
                                                          The present sequence is that of an N-terminal fragment of a novel
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             new composition useful as a vaccines against hepatitis C virus

The complementary peptides interact with their relevant target proteins encoded in the human genome. They can be used as reagents in drug discovery and as lead ligands to facilitate drug design and development. The present sequence is a complementary peptide provided in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                        Human; complementary peptide; ligand; drug discovery; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a set of complementary peptide ligands

New peptides are disclosed which include any peptide, peptide

derivative or peptide analogue which comprises either (1) at least a

4 amino acid portion of FF-4 (see AARG1401) or a functionally equivalent

sequence, or (1) at least a 6 amino acid sequence which is at least

66% homologous to a portion of the PF-4 sequence, or a functionally

equivalent sequence. Pref: the peptide contains the sequence

7 and/or Val-Arg-Pro-Arg. The most preferred peptide is

7 Thr-Thr-Ser-Gln val-Arg-Pro-Arg (AARG1393), designated CT-112.

7 Thr-Thr-Ser-Gln val-Arg-Pro-Arg (AARG1393), designated C-terminal, or may be

7 Thr-Thr-Ser-Gln val-Arg-Pro-Arg (AARG1393), designated C-terminal, or may be

7 Thr-Thr-Ser-Gln val-Arg-Pro-Arg (AARG1393), designated C-terminal, or may be

7 Thr-Thr-Ser-Gln val-Arg-Pro-Arg (AARG1393), designated C-1113, reperfusion tissue damage, inflammatory lung disease,

8 Thr Thr-Thritis, scleroderma, mixed connective tissue

8 Colitis, reperfusion tissue damage, inflammatory lung disease,

9 Traft-versus-host diseases, atherosclerosis and asthma.

9 The present sequence, designated CT-119, is a comparison purposes.

9 Thr Thr-Thr-Thritis (AT-112) and comparison purposes.

9 Thr Thr-Thritis (AT-112) and minibition of 78%. In

9 Thr Thr-Thritis (AT-112) and minibition of 78%. In

9 Thr Thr-Thritis (AT-112) argen a value of 74%.
                                 New peptide(s) and derivs. based on platelet factor 4 - used for inhibiting an immune response, including an inflammatory response in e.g. auto:immune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                43.3%; Score 26; DB 16; I

                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a set of peptide ligands consisting of specific complementary peptides to proteins encoded by genes of plant genomes. The present sequence is one such peptide from Arabidopsis thaliana. The peptides of the present invention are useful in an assay to identify a peptide, especially a peptide pesticide or harbicide. The peptides are also useful for tools for agricultural research and

production and an enhanced respiratory burst following treatment with N-formyl-L-methionine-L-leucyl-L-phenylalanine. The peptides are described generically. They are fragments from the region of amino acids 54 to 94 of human TNF, or analogues of such fragments. Their neutrophil-stimulating activity can be used in the treatment of diseases such as AIDS, cancer, rheumatoid arthritis, ARDS, cystic fibrosis, tuberculosis, Crohn's disease, sarcoidosis, leprosy, syphilis and malaria. The present sequence is one of 6 specific peptides having the above activity and which fit the the generic formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               TNF; tumour necrosis factor; neutrophil; superoxide; inflammation, ADS, cancer; rheumatold arthritis; ABDS; cystic fibrosis; tuberculosis; TB; Crohn's disease; sarcoidosis; leprosy; syphilis; malaria; adult respiratory distress syndrome.
                                                                                                                                                                                                          New peptides are provided which prime neutrophils for superoxide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "this residue is optionally N-acylated glycosylated"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel peptides which stimulate neutrophils - are fragments of tumour necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "this residue is optionally in amide ester form and may be glycosylated"

                                                                                                                                                                                                                                                                                                                                                                                                                    diabetes, Goodpastures syndrome, pemphigus and pemphigoid, primary bilary cirrhosis, ulcerative colitis, rheumatoid arthritis, scleroderma, mixed connective tissue disease and luqua serythematosus, graft versus host disease, septic shock, reperfusion injury (including injury subsequent to myocardial or cerebral infarction), atherosclerosis, asthma and inflammatory lung disease. The peptides give a new and effective method of inhibiting the inflammatory response by acting on cytokines rather than the prior art arachidonic acid.
                                                                                                                                                                                                                                                                                               The present sequence represents a peptide which is related to platelet factor 4 (PF4) and can be used to inhibit an inflammatory response. Peptides, peptide analogues and peptide derivatives of PF4 can be used for treating e.g. autoimmune diseases such as insulin dependent
                                                                                                                 New antiinflammatory peptide(s) based on platelet factor 4 sequences - used for treating e.g. auto:immune diseases, graft versus host disease, reperfusion injury, atherosclerosis or asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TNF; tumour necrosis factor; neutrophil; superoxide; inflammation; ADS, cancer; rheumatold arthritis, ARDS; cystic fibrosis; tuberculosis; TB; Crohn's disease; sarcoidosis; leprosy; syphilis; malaria; adult respiratory distress syndrome.

production and an enhanced respiratory burst following treatment with N-formyl-L-methionine-L-leucyl-L-phenylalanine. The peptides are described generically. They are fragments from the region of amino acids 54 to 94 of human TNF, or analogues of such fragments. Their neutrophil-stimulating activity can be used in the treatment of diseases such as AIDS, cancer, rheumatoid arthritis, ARDS, cystic fibrosis, tuberculosis, Crohn's disease, sarcoidosis, leprosy, syphilis and malaria. The present sequence is one of 6 specific peptides having the above activity and which fit the the generic formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inactivation; protein synthesis; N-glycosidase; adenine; ribosomal RNA; elongation factor 2; EF2-dependent GTPase; irreversible; inhibition; infectivity; reduction; replication; plant virus; tobacco mosaic virus; watermelon mosaic virus; cauliflower mosaic virus; potato virus; cauliflower mosaic virus; potato leafroll virus; cucumber mosaic virus; human disease; HIV-1; recombinant expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antiviral protein from Amarathus viridis. Amarandin-1 (AAY52586) and amarandin-2 (AAY52587) are inactivators of eukaryotic ribosomes. They have N-glycosidaes activity, cleaving the N-glycosidic bond of adenine in a specific ribosomal RNA sequence, thus modifying the EF (elongation factor)-2-dependent GTPase activity of the ribosomal subunit. This irreversibly impairs protein synthesis. Amarandins 1 and 2 have been shown to reduce infectivity of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents the N-terminal 11 residues of amarandin-1, an

through a linker to a solid phase, forming a complex of (A) solid phase.

Through a linker to a solid phase, forming a complex of (A) solid phase.

Where (A) comprises 10-50 amino acids capable of forming a secondary structure in a benign buffer after liberation from the solid phase, and curther the (A)-solid phase complex comprises an immunogenic substance and/or an immune mediator coupled on (A). The present sequence ceptacesents a peptide used in an example from the present invention. An (A)-solid phase complex can be used as a scaffold for the production of chemical derivatives, characterised by covalently attaching molecules at attachment points. Alternatively (A) is used as a scaffold for the production of chemical derivatives which is used for the chemical coupling of antigenic substances in an aqueous solution by conjugation. (A) derivatised with substances in an aqueous solution by conjugation. (A) derivatised with conform or more peptides having fibronectin. Imminin. Or vitronectin.like binding activities can be used for the promotion of cell-attachment to plastic surfaces, in particular to inhibit tumour growth and metastasis, and for promotion of yeculd healing. Also a derivatised (A) can be used for the selection of specifically-binding aptamers or as a diagnostic agent. Such diagnostic-(A) molecules could be used to detect molecules
                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     T-cell stimulatory peptide; immunogen; non-dendritic; carrier; tumour; scaffold; inhibition; metastasis; wound healing; solid phase.
tobacco mosaic virus and other plant viruses including watermelon mosaic virus, cauliflower mosaic virus, potato virus X and Y, potato leafroll virus and cucumber mosaic virus. These proteins may also be very important to inhibit replication by human viruses, e.g., HIV-1. DNA encoding amarandins 1 and 2 may be used in expression vectors for the recombinant expression of these antiviral proteins in a host cell.

The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T ceptides can bind to a manigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLS) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially to treat or prevent viral infections and cancers in mammals (especially humans) e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risks of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The

The present invention describes isolated prepared P53 epitopes (I). Also described are: (1) a cytotoxic T lymphocyte (CTL) that is cultured in vivo and bluds to a complex of (I): (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with less than 50 contiguous amino acids with 100% identity to the native peptide sequence of p53, and a paramaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II). (I) has oytostatic activity and can be used in vaccines. The vaccine composition is useful for treating or preventing cancer. (I) and (II) are useful as diagnostic agents and for evaluating immune responses. Unlike conventional epitopes, immunosuppressive epitopes that may be present in whole antigens can be avoided with the use of the vaccine composition of (I). The ability to combine selected epitopes and further, to modify the composition of the epitopes enhances the immunogenicity. The possible pathological side effects caused by infectious agents or whole protein antigens, which might have their own intrinsic biological activity, are eliminated. Ad689363 to Ad689747 represent amino acid sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes isolated prepared P53 epitopes (I). Also described are: (1) a cytotoxic T lymphocyte (CTL) that is cultured in vivo and binds to a complex of (I); (2) a peptide (II) comprising (I) and a second epitope and has less than 50 contiguous amino acids; (3) a vaccine composition comprising (II), a unit dose of a peptide with less than 50 contiguous amino acids with 100% identity to the native peptide sequence of p53, and a pharmaceutical excipient; (4) an isolated nucleic acid encoding (I); and (5) an isolated nucleic acid encoding (II). (1) has cytostatic activity and can be used in vaccines. The vaccine composition is useful for treating or preventing cancer. (I) and (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    are useful as diagnostic agents and for evaluating immune responses. Unlike conventional epitopes, immunosuppressive epitopes that may be present in whole antipens can be avoided with the use of the vaccine composition of (I). The ability to combine selected epitopes and further, to modify the composition of the epitopes enhances the immunogenicity. The possible pathological side effects caused by infectious agents or whole protein antipens, which might have their own intrinsic biological activity, are eliminated. AAG89363 to AAG89747 represent amino acid sequences used in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           neurturin isolated from CHO cell conditioned medium. Other internal peptides (see AAW300/8-79) and an N-terminal peptide (see AAW3007/8-79) and an N-terminal peptide (see AAW3007/8-79) and an N-terminal peptide (see paya007/8-79) of hamster neurturin has been isolated. Probes and primers based on these peptide sequences and used to obtain neurturin CDNA clones from related species; PCR primers (see AAR907/84-55) based on internal peptides P2 and P3 were used to isolate mouse and human neurturin CDNA clones. Neurturin is a member of the glial derived neurotrophic factor (GDNF) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         A novel member of the GDNF neurturin growth factor family, persephin (see AAW30064-68), was subsequently identified that can be used in claimed methods for preventing or treating neuronal degeneration, haematopoietic cell degeneration and cardiac muscle
                                                                     ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAW13712-W13715 represent internal fragments of neurturin (NT). These sequences, and the N-terminal fragment shown in AAW13712, were isolated from chinese hamster ovary (CHO) cells. These sequences were used to produce degenerate primers (see AAT61481 and AAT61482) which were used to isolate the human and mouse NT coding sequences (see AAT61468 and AAAT61469 respectively). NT promotes the growth and differentiation of haematopoletic and neuronal cells, and their stem cells. The NT gene protein are used to prevent or treat neurodegenerative diseases, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                diseases, e.g. eosinopaenia, basopaenia, lymphopaenia, monocytopaenia, neutropaenia, anaemia, thromobocytopaenia and stem cell insufficiencies. The NT protein and gene are also useful to treat neuroblastomas. Antibodies against NT and oligonucleotides (used as either probes or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peripheral neuropathy, amyotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease, Huntingdon's disease, ischaemic stroke, acute brain injury, acute spinal cord injury, nervous system tumours, multiple sclerosis and infection; and haematopoietic cell degenerative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   primers, corresponding to an exon of pre-pro-NT gene or flanking a target sequence) can be used for detecting NT in a sample or detecting mutations in the NT gene. Antisense sequences of the NT gene are used treat diseases promoted by NT expression e.g. obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A novel growth factor Neurturin - used to treat neuro-degenerative and haematopoietic cell degeneration diseases, e.g. Alzheimer's

The persephin of Polypeptides can promote the survival and growth of neurons and non-neuronal cells. The persephin GF polypeptides or polynucleotides can be used for preventing or treating cellular degeneration or insufficiency, e.g. neuronal degeneration resulting from peripheral neuropathy, amyotrophic lateral sclerosis, Alzheimer's disease, Parkinson's disease, Huntington's disease, ischemic stroke, acute brain injury, acute spinal cord injury, nervous system tumours, multiple sclerosis, or infection, hematopoietic cell degeneration or insufficiency resulting from eosinopenia, anemias, thrombocytopenia, or stem-cell insufficiences, cardiac muscle degeneration or insufficiency resulting from congestive heart failure. They can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                be used for treating e.g. peripheral nerve trauma or injury, exposure to neurotoxins, metabolic diseases such as diabetes or renal dysfunctions and damage caused by infectious agents. The GF can also be used for promoting the growth and/or differentiation of a cell in a culture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 medium. The antisense polynucleotides can be used for treating a disease condition mediated by expression of persephin by a population of cells. The products can also be used for detection and diagnosis.
                                                                                                                                        peripheral neuropathy; amyotrophic lateral sclerosis; ischemic stroke; Alzheimer's disease; Parkinson's disease; Huntington's disease; trauma; brain injury; spinal cord injury; nervous system tumour; infection; multiple sclerosis; cardiac muscle degeneration; injury;neurotoxin; metabolic disease; diabetes; renal dysfunction; neurturin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

New peptides are provided which prime neutrophils for superoxide production and an enhanced respiratory burst following treatment with N-formyl-L-methionine-L-leucyl-L-phenylalanie. The peptides are described generically. They are fragments from the region of amino acids 54 to 94 of human TNF, or analogues of such fragments. Their neutrophil-stimulating activity can be used in the treatment of diseases such as AIDS, cancer, rheumatoid arthritis, ARDS, cystic fibrosis, tuberculosis, Crohn's disease, sarcoidosis, leptosy, syphilis and malaria. The present sequence is one of 6 specific peptides having the above activity and which fit the the generic formula.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         T-cell stimulatory peptide; immunogen; non-dendritic; carrier; tumour; scaffold; inhibition; metastasis; wound healing; solid phase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence is one of a large number of complementary peptide ligands generated from Mycoplasma genitalium genome sequences. These specific complementary peptides interact with their relevant target proteins encoded by the microbial genome. They are capable of antagonising or agonising specific interaction of a protein with another protein or receptor and aret thus useful as reagents and drugs, can as lead ligands to facilitate drug design and development. They are useful as tools for functional genomic studies, reagents for the configuration of high-throughput screens, as a starting point for medicinal chemistry manipulation, for peptide mimetics and as therapeutic agents. The analysis and acquisition of peptide sequences facilitates understanding of protein-protein interactions. The method callows for analysis of an entire database at a time, thus overcoming intermolecular (between proteins) and intermolecular (within a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ő

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      q
                                                                                                                                                                                                                                                                                                                        through a linker to a solid phase, forming a complex of (A)-solid phase.

through a linker to a solid phase, forming a complex of (A)-solid phase.

Where (A) comprises 10-50 amino acids capable of forming a secondary

structure in a benign buffer after liberation from the solid phase, and

further the (A)-solid phase complex comprises an immunogenic substance
and/or an immune mediator coupled on (A). The present sequence
and/or an immune mediator coupled on (A). The present sequence
cepresents a specifically claimed cytokine derived peptide from the
present invention. An (A)-solid phase complex can be used as a scaffold
for the production of chemical derivatives, characterised by covalently
attaching molecules at attachment points. Alternatively (A) is used as
a scaffold-peptide for the incorporation into an Immunostimulating
complex (Iscom) resulting an (A)-iscom complex which is used for the
complex (Iscom) resulting an (A)-iscom complex which is used for the
conjugation. (A) derivatised with one or more peptides having
fibronectin., laminin- or vitronectin-like binding activities can be
cused for the promotion of cell-attachment to plastic suffaces, in a
particular to inhibit tumour growth and metastasis, and for promotion
of specifically-binding aptemers or as a diagnostic agent. Such
diagnostic-(A) molecules could be used to detect molecules derived from
or indicative of pregnancy or of a disease, such as an infectious,
autoimmune or cancerous disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present sequence represents a peptide derived from a human tumour necrosis factor peptide. The peptide can have neutrophil and/or neorosis factor peptide. The peptide is derived from concyte/macrophage stimulatory activity. The peptide is derived from the sequence of tumour necrosis factor (TWT)-derived peptide 419

CPSTHVLITHTI; see AU74762/91 and 44664/93). It can have improved properties such as increased potency, extended in vivo half life or, particularly, specificity of action. It can have neutrophil stimulatory activity (class 1), equal neutrophil and monocyte/macrophage stimulatory activity (class 2), or preferentially enhanced monocyte/macrophage stimulatory activity (class 3). It can be used for the treatment or prevention of infection. In particular, it can be used for treatment or prevention of infections. In particular, it can be used for treatment or prevention of infections. In particular, meningitis, Mycobacteria, chiamydia, Brucellae, Francisella, Pasteurellosis, Legionellosis, Histoplasmosis, Listeriosis, Pneumocystis carnii, Trypanosoma cruzi, coccidian parasitical infection, an inherited primary defect of phagocytic cell function, an inherited secondary defect of phagocytic cell function, an inherited secondary defect of phagocytic cell function, an inherited coll function, immunosuppression due to the administration of immunosuppressive drugs, and other bacterial, fungal, varial or protozoan infection, infectious mononucleosis, paroxysomal concerns, host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 13,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

; Patent No. 5843914
; GENERAL INFORMATION:
; APPLICANT: MILBRANDT, JEFFREY D.
APPLICANT: MILBRANDT, JEFFREY D.
APPLICANT: KOTZBAUGR, PAUL T.
APPLICANT: CAMPE, PATRICIA A.
TITLE OF INVENTION: NEURTURIN AND RELATED GROWTH FACTORS
; NUMBER OF SEQUENCES: 78
; CORRESPONDENCE ADDRESS:
                  APPLICANT: JOHNSON JR., EUGENE M.
APPLICANT: MILBRANDT, JEFFREY D.
APPLICANT: KOTSBAUER, PAUL T.
APPLICANT: LAMPE, PATRICIA A.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

--- SUBUNIT: DIDECAMERS AND EXTENDED MULTIMERS.
--- SUBCELLULAR LOCATION: EXTRACELLULAR.
--- TISSUE SPECIFICITY: HEMOLYMPH.
--- PIOTECHNOLOGY: Potent immunogen used classically as a carrier protein for haptens and more recently in human vaccines and for immunotherapy of bladder cancer.
--- SIMILARITY: BELONGS TO THE TYROSINASE FAMILY. HEMOCYANIN SUBFAMILY.
-!- MISCELLANEOUS: ON THE 2D-GEL THE DETERMINED PI OF THIS UNKNOWN PROTEIN IS: 5.0, ITS MW IS: 11.7 kDa.

"Isolation, primary structure and bioactivity of schistofirf-amide,
FMRF-amide-like neuropeptide from the locust, Schistocerca
                                                                                                                  01-JUL-1993 (Rel. 26, Created)
01-JUL-1993 (Rel. 26, Last sequence update)
01-JUL-1993 (Rel. 40, Last annotation update)
Unknown protein from 2D-page of liver tissue (Spot 106) (Fragment).
Homo sapiens (Human).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-0CT-1994 (Rel. 30, Created)
01-0CT-1994 (Rel. 30, Last sequence update)
30-MAY-2000 (Rel. 39, Last annotation update)
SchistoFirRemide (PDVDHFLRF-maide) (Cardioexcitatory neuropeptide).
Locusta migratoria (Migratory locust), and
Schistocerca gregaria (Desert locust).
Eukaryota, Metazoa; Arthropoda; Tracheata; Hexapoda; Insecta;
Pterygota; Neopters; Orthopteroidea; Orthoptera;
McIdomorpha; Acridoidea; Acrididae; Locusta.
